

Contour-enhanced funnel plot: PONV within 24 h, TEAS versus sham

Exploratory; $k = 10$ is the conventional minimum; not used to change GRADE

$k = 10$ trials; contours mark two-sided p-value regions around no effect; vertical line: inverse-variance (common-effect) estimate.
Harbord test for small-study effects: $z = -3.66$, $p = 0.000$. Low power at $k = 10$; exploratory, not used for GRADE.
Model ponv24_TEAS_sham (core). StataNow/SE 19.5, 13_STATA/do/04_figures.do.
