

Leave-one-out: PONV within 24 h, TEAS versus sham

Influence diagnostic, not a new evidence body

Risk ratio
with 95% CI

Omitted study

Each row re-fits the random-effects model (REML, truncated Knapp-Hartung) without the named study.
Solid line: estimate with all 10 studies, 0.64 [0.52, 0.79]. Heterogeneity: $\tau^2 = 0.0342$, $I^2 = 47.5\%$; Test of homogeneity: $Q(9) = 17.80$, $p = 0.038$.
95% prediction interval: 0.40 to 1.02 (t, k-1 df)
Model ponv24_TEAS_sham (core). StataNow/SE 19.5, 13_STATA/do/04_figures.do.
